Earlier work and dated evidence

Appendix to the APL documentation | Claudio Verdi | 26 October 2026

My work on AWS, Hetzner and GenAI was underway before the supplementary work on 23–24 October 2026. This appendix brings together dated information from earlier conversations, terminal output and screenshots. The evidence shows earlier preparations and several completed tasks. It does not establish that every task in every AWS level was complete at the same earlier date.

How to read this appendix

The date of an event is distinguished from the date it was documented. For example, a screenshot taken on 23 October may show a September launch time. Key pair dates show when AWS registered a key pair. A successful web test shows that the server responded during that test. These records support different conclusions.

The screenshots below are embedded from my uploaded files. Earlier conversations are presented as summaries and short excerpts, rather than complete exports. No new screenshot of an earlier session has been created. The dates in the existing reports for new execution, verification and GitHub publication on 23–24 October remain unchanged.

Timeline

- 17 September: AWS records the creation of the ec2kp key pair.
- 22–23 September: the Level 2 instance and earlier Terraform work are documented in AWS and the conversation history.
- 1 October: a local Hetzner test in the earlier conversation returned HTTP 200. On 2 October I described the result in Veckorapport 6.
- 6–7 October: Arithmancy development, Bedrock testing and deployment of the GenAI application.
- 23–24 October: supplementary execution, checks, screenshots and documentation. The GenAI code was published on GitHub on 24 October.

AWS recorded dates for instances and key pairs

In pics.docx, the EC2 list shows a launch time of 22 September 2026 at 16:02 GMT+2 for the row with level2-key, and 7 October at 04:09 GMT+2 for the GenAI row. Another image in the same document identifies the rows as level2-web-server and HouseVerdi-Arithmancy. The screenshots were taken on 23 October.

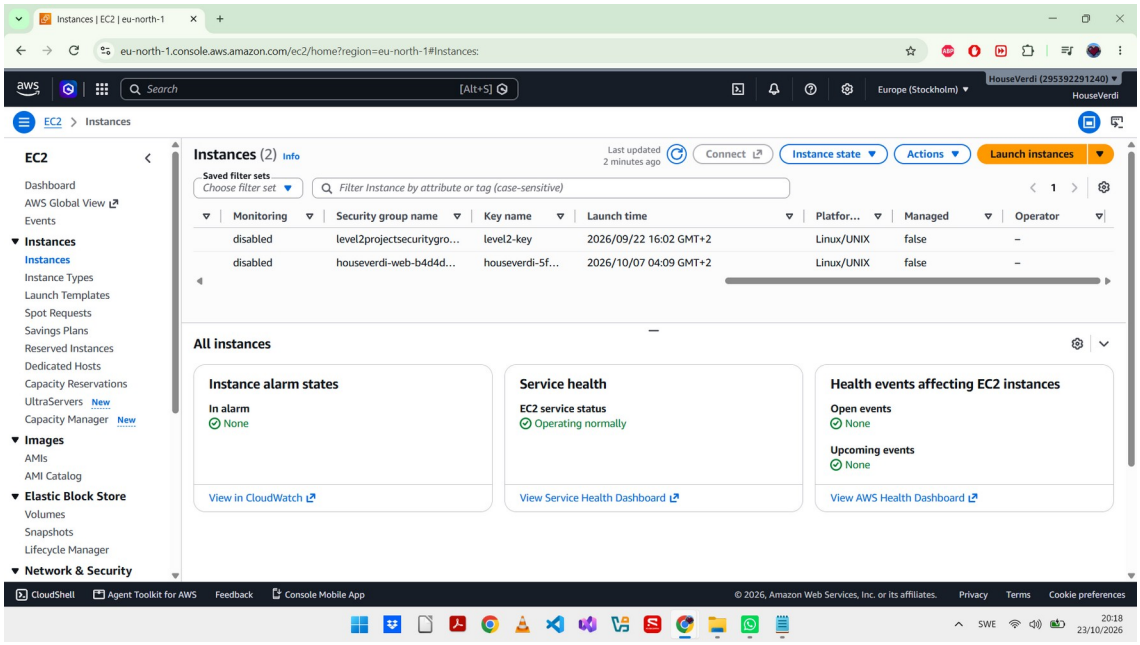

Figure 1. The EC2 Launch time column shows earlier launch dates. Source: pics.docx, image containing the Launch time column.

The Key pairs view shows ec2kp on 17 September at 14:57, level2-key on 22 September at 15:04, level3-key on 23 September at 01:27 and the HouseVerdi key on 7 October at 04:09. All times are displayed as GMT+2. These dates support earlier AWS preparation; they do not prove that a complete level had been finished then.

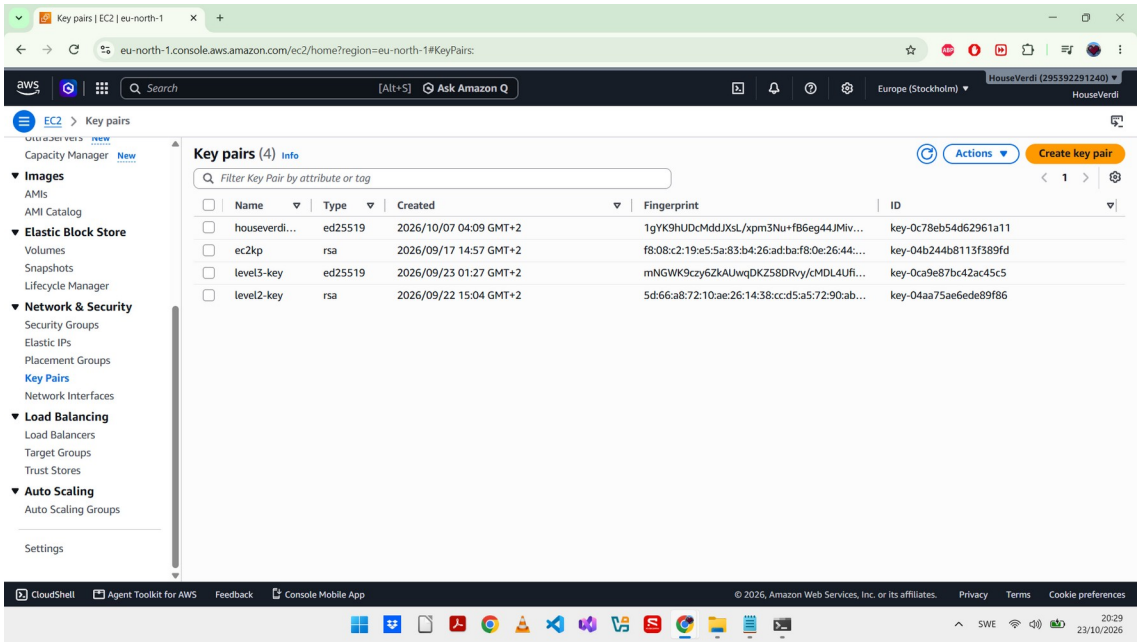

Figure 2. Creation dates of the AWS key pairs. Source: pics.docx, Key pairs view.

CloudTrail and earlier Terraform work

The CloudTrail RunInstances event records that Level 2 instance i-00d4bfd970ff8f5f6 was created on 22 September 2026 at 16:02:31 Swedish time. The JSON file gives 2026-09-22T14:02:31Z. The userAgent field includes aws-cli and ec2.run-instances. This supports creation through AWS CLI before the October supplementary work.

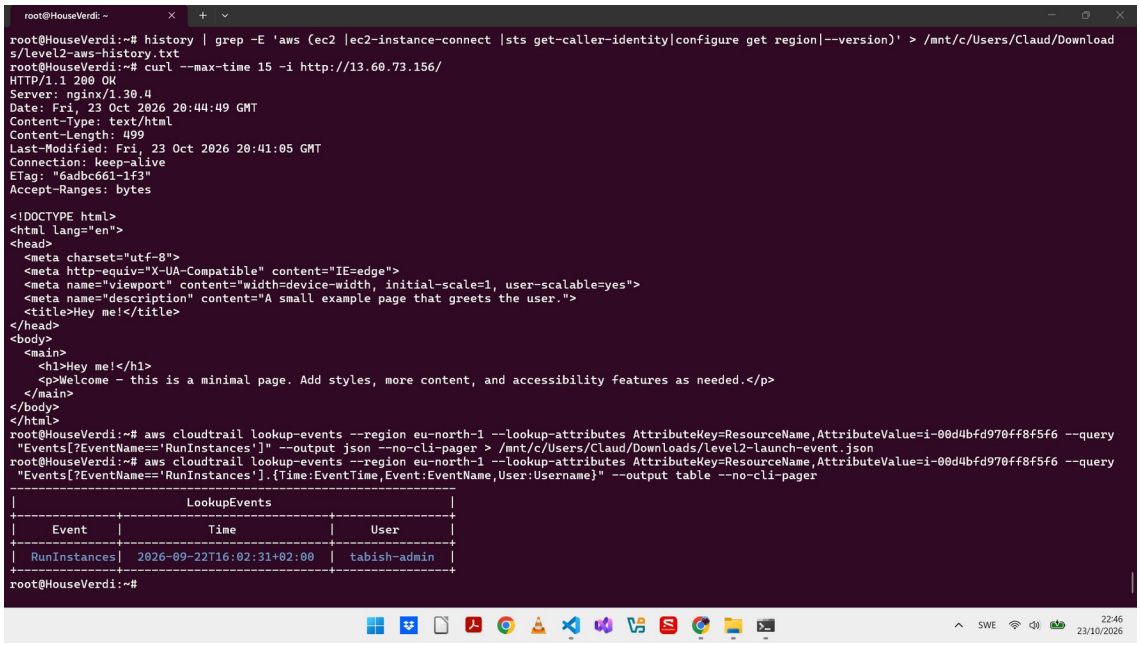

Figure 3. The CloudTrail event from 22 September is displayed in a terminal screenshot taken on 23 October.

What the earlier conversations show

In Clean rewrite, Script Assistance and Review Shell Script, I worked through scripts, SSH, keys, AWS CLI and Terraform. Retrieved September excerpts contain both my execution results and instructions from the assistant. A syntax-checked script or an example of successful output does not by itself count as my execution.

A retrieved terminal result from the night of 22–23 September, Swedish time, identifies Terraform instance i-0e1cc068f4f6f8141 with DNS ec2-16-16-78-153.eu-north-1.compute.amazonaws.com. The excerpts include cloud-init status and the verification text below. This is summarized conversation evidence, not a new original screenshot.

```
status: done
YES — deployment verified.
```

Later output shows a replacement with 1 added, 0 changed, 1 destroyed. The subsequent attempt also encountered a missing Nginx service and an empty user-data script. The history therefore supports earlier practical Terraform work and a successful verification, but is not used as proof that all four iterations were fully complete in September.

GenAI development on 6 October and instance launch on 7 October

The Antigravity screenshot shows my request to add Chaldean, Chinese numerology and Indian Vedic System, dated 6 October 2026 at 23:15. The message Individual quota reached is also visible. This supports the earlier development history and explains why I continued in ChatGPT. It does not show that this particular requested change was completed in Antigravity.

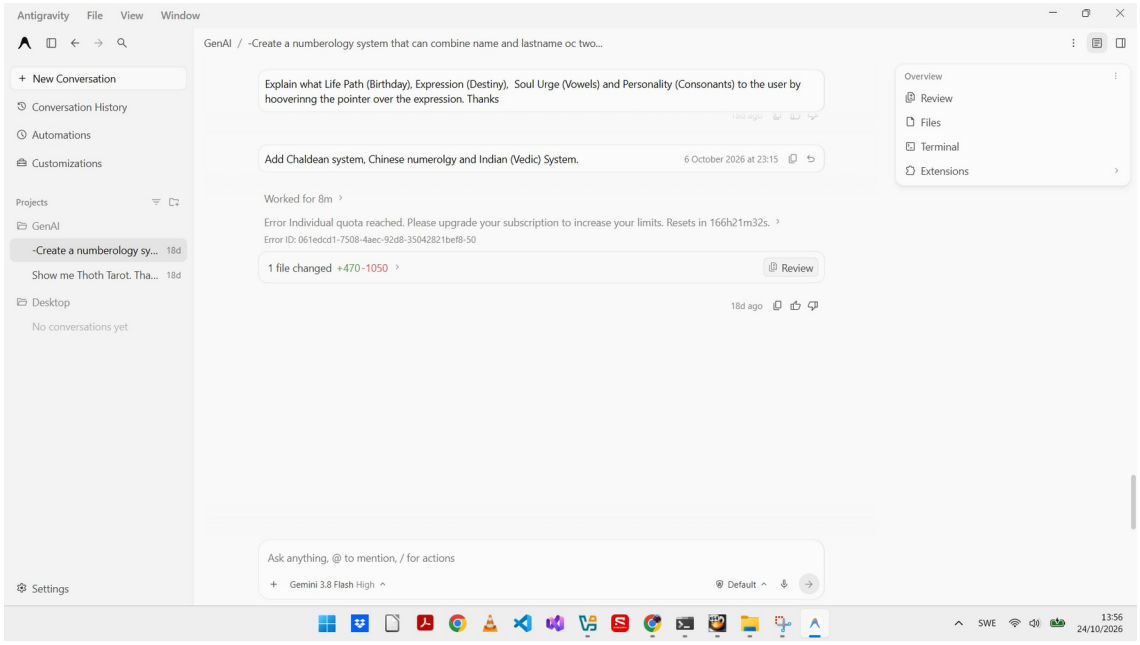

Figure 4. Dated request in Antigravity. The screenshot was taken on 24 October, but the message is dated 6 October.

AWS shows a Launch time of 7 October 2026 at 04:09:51 GMT+0200 for HouseVerdi-Arithmancy, instance i-00f140425a029a738. This supports earlier instance creation. The successful AI request is addressed separately in the conversation evidence.

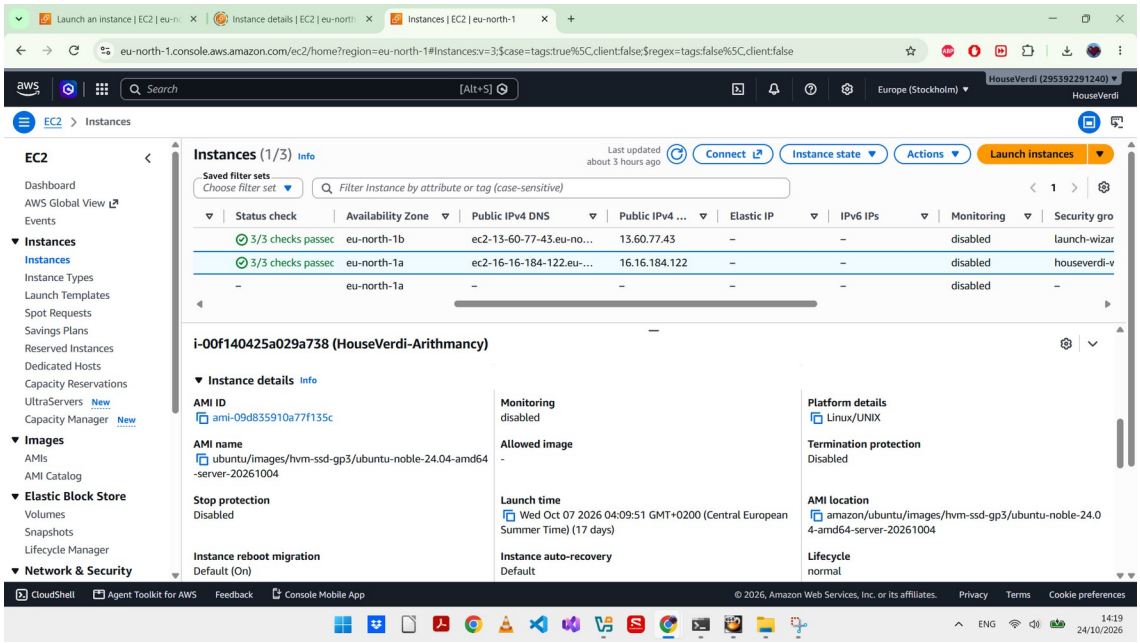

Figure 5. Recorded GenAI instance launch time on 7 October. Screenshot taken on 24 October.

GenAI project files and earlier login

File Explorer shows modification dates of 7 October for files and folders including ai_service, app, templates and numerology_system. File metadata provides supplementary support that the project files existed before the supplementary work. A modification date alone does not show that a feature was deployed or tested.

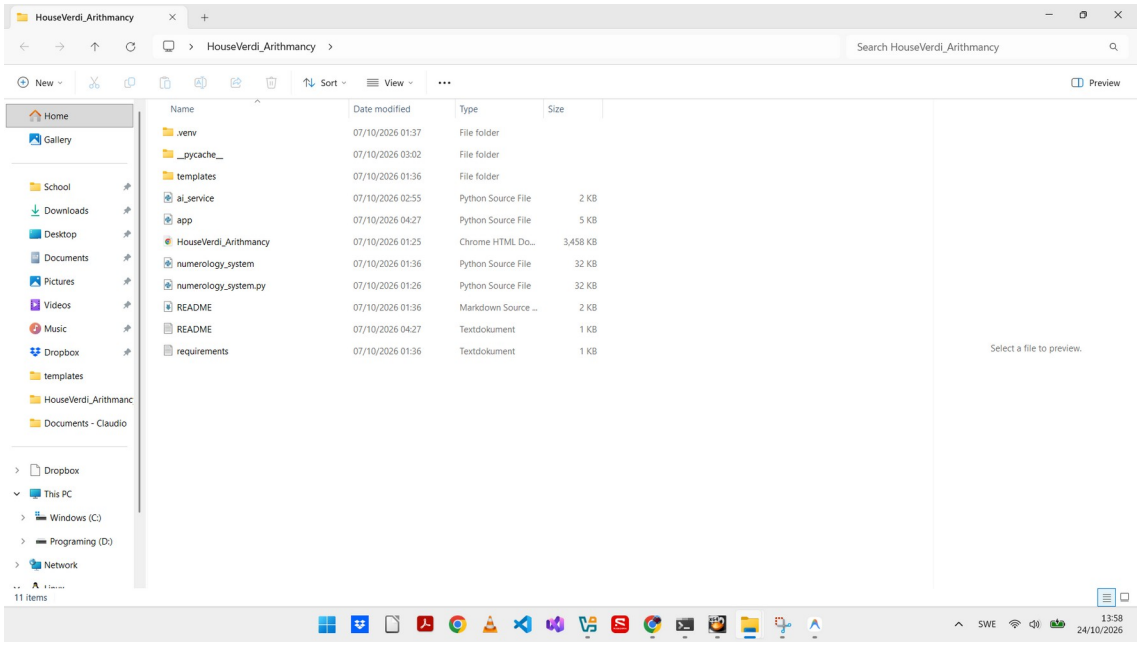

Figure 6. Local project files with modification dates of 7 October. Screenshot taken on 24 October.

The server login history shows Last login: Wed Oct 7 02:10:59 2026. This supports an earlier login. However, the services' active since lines in the same image refer to 24 October and are not used as proof of continuous operation since 7 October.

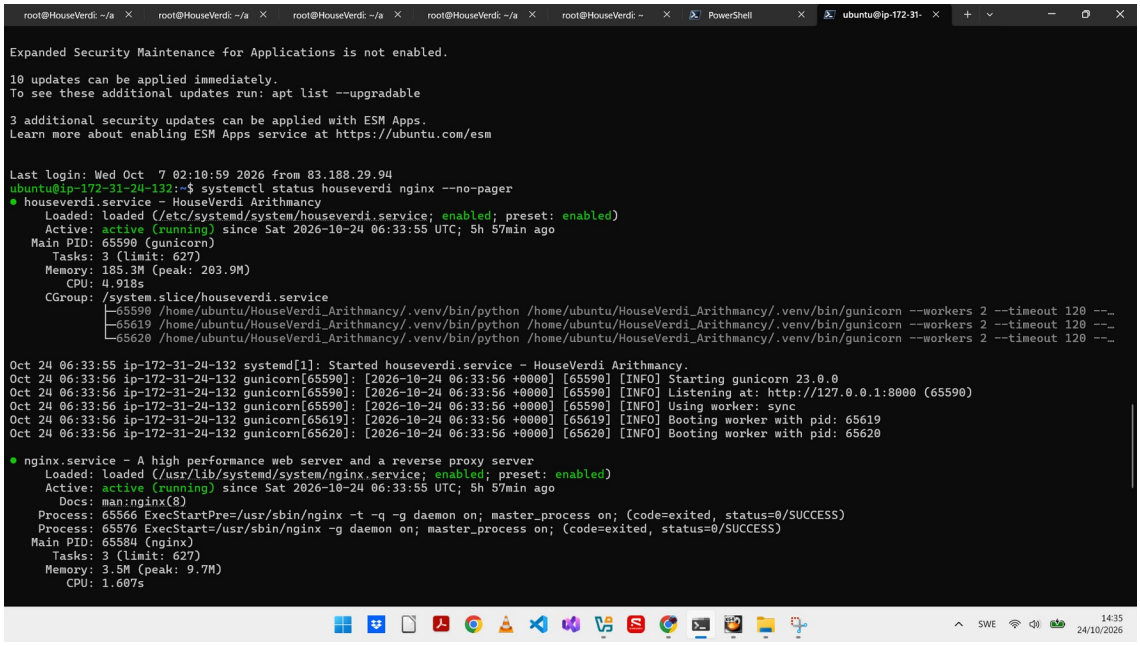

Figure 7. Earlier login shown above the service check. The other service status information concerns the October supplementary work.

Earlier results for Hetzner and GenAI

Hetzner on 1 October

The following pasted terminal excerpt appears in the earlier conversation Backup and restore steps. It is text from the conversation history, rather than an embedded original screenshot. The HTTP header gives 1 October 2026 at 15:01:55 GMT, equivalent to 17:01:55 Swedish summer time.

```
PS C:\Users\Claud> curl.exe -k -I --max-time 20 `
  --resolve wordpress.multinomial.se:443:192.168.56.101 `
  https://wordpress.multinomial.se/
HTTP/1.1 200 OK
Date: Thu, 01 Oct 2026 15:01:55 GMT
Server: Apache/2.4.58 (Ubuntu)
Link: <https://wordpress.multinomial.se/index.php?rest_route=/>;
 rel="https://api.w.org/"
Content-Type: text/html; charset=UTF-8
```

The command is line-wrapped for readability; its address, flags and reported response values are reproduced from the conversation. The --resolve option explicitly targets the local VM address 192.168.56.101. The response supports that the local server delivered a WordPress response at test time. The -k flag disables certificate verification, so the test does not establish a valid certificate chain.

In Veckorapport 6 on 2 October, I wrote that I had completed the Hetzner task and reached the page after troubleshooting and reinstalling Ubuntu in VirtualBox twice. This is my contemporary account of the work and complements the technical test. The supervisor supplied the backup files; I do not claim to have created them.

GenAI on 7 October

Request changes contains my server command in ~/HouseVerdi_Arithmancy and an AI RESPONSE with generated welcome text. The following command lines are reproduced from that conversation:

```
cd ~/HouseVerdi_Arithmancy
export BEDROCK_REGION=eu-north-1
export BEDROCK_MODEL_ID=eu.amazon.nova-micro-v1:0
.venv/bin/python ai_service.py
```

I subsequently wrote all works. Together, the command, generated response and my confirmation support that the AI integration was tested before the supplementary work. Calculator Design Review also contains my earlier requirements and interface change requests. Individual changes are not treated as fully tested merely because they were requested in the chat.

Scope and sources

What this appendix adds

This appendix shows that parts of the work were performed earlier and that the supplementary work on 23–24 October was not the starting point of the projects. Documentation dates, resource dates and test dates should be read separately. The evidence does not itself determine the school's assessment or imply that all requirements were met before the supplementary work.

AWS Level 1 has earlier SSH and script work and key metadata. Level 2 has both a recorded September launch and earlier conversation results. Level 3 has earlier Terraform runs, but no reliable complete mapping to all four iterations. Execution and verification of the iterations on 23–24 October remain as documented in the individual reports.

Untitled document.docx contains four EC2 screenshots dated 24 October. The instance IDs for iterations 2, 3 and 4 correspond to the October supplementary work. These images are therefore not used as proof of September execution and have not been embedded again in this appendix.

Screenshots and files

- pics.docx: two reproduced screenshots showing Launch time and Key pairs. Other images include a Keychain check and creation of the new Level 1 instance on 23 October.
- level2-launch-event.json and image(20261023-204641).png: CloudTrail event and terminal display for Level 2.
- image(20261024-115656).png: Antigravity with a dated message.
- image(20261024-121953).png: GenAI instance launch time.
- image(20261024-115820).png: project file modification dates.
- image(20261024-123529).png: earlier login and current service status.
- Untitled document.docx: reviewed supplementary evidence, not embedded here.

Earlier conversations

Clean rewrite, Script Assistance and Review Shell Script: scripts, SSH, AWS CLI and Terraform during September. AI skrivassistent AWS deployment and Calculator Design Review: the GenAI assignment and development on 6–7 October. Request changes: AI testing and deployment work on 7 October. Backup and restore steps: restoration work and the HTTP response above on 1 October. Veckorapport 6 Redigering: my account of the Hetzner result on 2 October.

The conversation information is based on available historical excerpts. Complete original exports are not attached here. The precise dates of the screenshots and AWS event can be read directly in the embedded evidence. This appendix supplements the separate APL reports.
